

SITE MAP (pictures)

Welcome

BoNiPe Store

We want to state that the security in our program is not that good, since you can fetch some of the data Without the need authorisation and also - since this it the first time we are making a project from that scale some of the code could be useless or mixed in illogical way, we apologize for that.

Our website represents a 'store page' where you can buy items. An admin can login so that he/she can add new products to a database or check and edit created orders. A customer can login so that she/he can order different products which should be handled by the administrators afterwards.

However, our program is small - we should admin that there are a lot more stuff TODO in order to have a working "BUY-SELL" website. I guess this is good enough and it's showing what we learnt during this semester

Namaste!
